

Management For Security Patches

- We have hackers inside our network.
- We can't do much to kick them out.
- We can and we should fix all exploits.
- We want to offer two ways for that:

- Patch the systems instantly with salad.
- Inform the admins that they fix the systems.
- Salad functions need to know whom to inform. Something like /etc/local/admins which contains an email address of the admin mailing list for this machine would be handy.
